Professional Summary

Software Engineer experienced in building backend services, event-driven systems, frontend applications, shared developer tooling, and cloud infrastructure for a multi-tenant K–12 EdTech platform. Strong foundation in API design, distributed systems, data modeling, object-oriented programming, and data structures and algorithms.

Experience

Compro Technologies — Delhi *Jan 2025 – Present*

Software Engineer

Project: K–12 LMS (School Framework) — multi-tenant platform supporting 1M+ active users across schools

- Built the core Roster Service to model **6 OneRoster entities** -- organizations, users, courses, classes, enrollments, and academic sessions -- per the 1EdTech OneRoster data standard, with dedicated Lambda handlers per entity to process incoming roster data.
- Integrated Rostersteam (Ednition) as the roster ingestion source, consuming OneRoster-formatted CSV data through event-driven Lambda handlers to **automate onboarding** across multiple schools.
- Built a Calendar Service end to end -- event modeling, ingestion, and calendar-date processing following the EdFi standard schema -- using a **CQRS-based read model** for user-course aggregations and progress tracking, improving read throughput by roughly **35%** while supporting multi-tenancy.
- Architected and delivered an **event-driven transcript generation platform** using AWS SQS, Lambda, DynamoDB, API Gateway, and S3, maintaining **99.9% availability**.
- Reduced frontend load times by cutting **FCP and LCP by ~0.5s** via image optimization, lazy loading, and code splitting; refactored **15+ legacy modules** into a reusable component library; and fixed a **cross-tenant session-leakage vulnerability** across the Onboarding and Teaching applications, restoring correct tenant, session, and domain isolation.
- Built and documented an internal service SDK, provisioned infrastructure via AWS CDK, and shipped **15+ REST APIs and 10+ GraphQL APIs** across **5 microservices** with JWT authentication, request validation, caching, rate limiting, centralized structured logging, and automated error handling -- reducing incident-investigation time by roughly **30%**.

Projects

Linkora -- Scalable URL Shortener *Nuxt.js, Vue.js, TypeScript, Express.js, DynamoDB, AWS CDK*

Live: linkora-mnyr.onrender.com | **Code:** github.com/imsamyak/url-shortner | **Architecture:** linkora-mnyr.onrender.com/architecture

- Engineered a **full-stack URL shortener** with a **Nuxt 4/Vue 3 SSR client** and a modular **Express 5/TypeScript REST API**; implemented authenticated workspaces, link creation, expiration, and redirection.
- Designed a **single-table DynamoDB model** with **cursor-based pagination** and **native TTL attributes** for scalable access patterns and automatic cleanup of expired redirects.
- Secured API flows with **password hashing**, **intent-scoped authentication**, **schema validation**, and **protected server-side gateways**.
- Provisioned a **two-AZ cloud architecture** with traffic distribution, auto scaling, firewall protection, and monitoring, plus rolling CI /CD; tested core services with unit and end-to-end tests.

Education

Maharaja Agrasen Institute of Technology, GGSIP University — Delhi

Bachelor of Technology in Computer Science and Engineering — CGPA: 8.95 *2025*

Technical Skills

Languages: Java, JavaScript (ES6+), TypeScript, SQL

Backend & APIs: Spring Boot, JPA, Hibernate, Spring MVC, REST, OpenAPI, GraphQL

Databases: PostgreSQL, Redis, MySQL, DynamoDB

Messaging: Kafka, AWS SQS, AWS SNS

Cloud & DevOps: Docker, AWS Lambda, AWS S3, CloudWatch, CI/CD, CloudFront, EC2, ECS, ALB, VPC, AWS CDK

Tools & Testing: Git, GitHub, Postman, SonarQube

Concepts: SOLID Principles, API Design, Agile Methodologies, Data Structures & Algorithms, OOPs, Microservices, Event-Driven Architecture, Domain-Driven Design, CQRS, Cloud Computing

AI-Assisted Development: GitHub Copilot, Claude

Certifications

- Java Full Stack Development -- Wipro TalentNext
